### **elisa and AudioCDs**

Time for an update. I made a lot of things the last days and weeks for elisa. Because it is really new rewritten at the moment, I didn't publish my work yet. I'll publish it, when the rewrite is done and the plugins run stable. For e.g. I worked on a new API / Implementation of Television inside elisa. But I also made coding work. So I rewrote my CDDA-Audio-Plugin. That was a plugin which read the audiocd, looked it up in cddb and was able to play the tracks. According of the used license it couldn't become part of elisa (which is under BSD and GPL). Because of this and it's very slow lookups I made a rewrite with the very good musicbrainz-Database. It works good for now, but the plugin should also rip the tracks one day. When this is possible and of course it runs stable under the elisa rewrite, I'll publish it here. For now I'll only show you a small Screencast of [it.2007\\_05\\_13\\_elisa\\_musicBrainz\\_AudioCD\(usedByHAL\)\\_withGoodIconHochgeladen von amasoean](#)
